1 Copyright and Creative Commons

1. Explain the relation between Copyright and Creative Commons (few sentences is enough).

Answer: Copyright and Creative Commons both address the issue of how creative works such as music, literature, and software can be protected and used. Copyright automatically gives creators exclusive rights to their works, while Creative Commons provides a set of standardized licenses for creators to grant others permission to use their works in specific ways.

2. Name disadvantages (i.e. criticism) of Copyright and Creative Commons (1-2 is enough).

Answer: One criticism of copyright is that it can limit creativity and collaboration, and it can be difficult and expensive to enforce, particularly in the digital age. One criticism of Creative Commons is that the licenses may not be universally recognized or enforceable in all regions.

3. Name and explain Creative Commons licenses (give at least five examples of licenses).

Answer: Creative Commons licenses include:

- a) CC BY: Attribution, which allows for the work to be used for any purpose, as long as credit is given to the original creator.
- b) CC BY-SA: Attribution-ShareAlike, which allows for the work to be used and modified, as long as credit is given and the resulting work is shared under the same license.
- c) CC BY-ND: Attribution-NoDerivatives, which allows for the work to be used for any purpose, as long as credit is given, but the work may not be modified.
- d) CC BY-NC: Attribution-NonCommercial, which allows for the work to be used for non-commercial purposes, as long as credit is given.
- e) CC BY-NC-SA: Attribution-NonCommercial-ShareAlike, which allows for the work to be used for non-commercial purposes and modified, as long as credit is given and the resulting work is shared under the same license.

4. Explain what patent is and how it is different from Copyright.

Answer: A patent is a sort of legal protection that grants the owner the exclusive right to create, use, and sell an invention for a set period of time (usually 20 years from the date of filing). It differs from copyright in that it protects practical products rather than creative works, and it gives a different form of protection (the right to prevent others from creating,

using, or selling the invention) than copyright (the right to control the use and distribution of a creative work).

5. Imagine you would like to create an online language course to teach German that would be completely free and shareable. While you need to invest your own resources into setting up a web platform, you still would like to get some profit from your idea. Given the setting:

- Give an example of how you can still generate profit by sharing your content for free.
- Explain whether and how your idea can be protected by any of the Creative Commons licenses.

Answer: To earn profit from your online language course, you could include advertising, sell premium content or resources, or offer certification for a fee. While the Creative Commons licenses were created for creative works, they may not be suitable for commercial products or services like your language course. To protect your rights and ensure others cannot profit from your work without your permission, consider traditional copyright law or alternative business models that don't involve licensing your content.

2 Misinformation (part 1)

Manipulation of information can be roughly subdivided into the following types:

- Fabricated content
- Manipulated content/clickbait/framing
- Imposter content
- Misleading content
- False context of connection
- Satire and parody

Below you can see examples (Figures 1-7) of misinformation or disinformation in a form of screenshots from different websites. Your task is to find out which of the above-listed types can be attributed to each of the screenshots. Note, multiple types can be applied to the same screenshot. Provide a brief explanation (1-2 sentences) of what makes you think that a particular type should be attributed to a particular screenshot.

Answer:

Fabricated content - It refers to the creation of completely false content and is spread to deceive and harm others. Example of this includes fake news articles or fabricated data.

Manipulated content/clickbait/framing - It refers to the manipulation of genuine information through different factors such as misleading headlines or framing to mislead users and it mostly deceives people by clickbait.

Imposter content - It refers to the impersonation of genuine information or using fake accounts to spread false information. Fake accounts or websites or social media profiles are created where well-known names are used to make the legit information.

Misleading content - It refers to the spread of false or incomplete information that is not entirely false but is presented in a way that misleads or misrepresents the truth. For instance, comments or quotes using as facts.

False context of connection - It refers to the information which is true but its presentation creates false associations or connections between people, events, or ideas. This can be achieved through misleading images or captions.

Satire and parody - It refers to the creation of information that is meant to be humorous or satirical. It can be fake news articles, fake interviews, or humorous memes. They are intended not to harm, but rather to entertain or fool readers.

Outraged experts charge: CORONAVIRUS IS CHINESE BIOWEAPON!

National Enquirer | May 11, 2020

PLAGUE WAS BORN AT LAB – NOT MEAT MARKET – SAY EXPERTS

THE coronavirus was deliberately engineered as a bioweapon in a Chinese lab!

That's the bombshell claim of a criminal complaint filed by former U.S. Justice Department prosecutor Larry Klayman at the International Criminal Court in The Hague, Netherlands!

He's also filed a lawsuit against the People's Republic of China, its president, Xi Jinping, and other government officials seeking trillions of dollars in damages, The National ENQUIRER has learned.

It comes as COVID-19 has infected more than 2.6 million people worldwide and claimed the lives of over 183,000 as it brought economies around the world to a near standstill.

In the U.S., more than 50,000 people have died of the dreaded disease and it's infected more than 1 million Americans.

The blockbuster lawsuit calls for an inquiry into "the likely creation and release, accidental or otherwise, of a variation of coronavirus known as COVID-19 ... as a biological weapon."

The lawsuit adds China planned to use "such weapons against its perceived enemies, including but not limited to the people of the United States.

"The Chinese government has denied claims the virus came from a lab — sticking to the official narrative that it was transferred to humans from a bat sold as food at a "wet" market in the city of Wuhan.

Yuan Zhiming, the director of the Wuhan National Biosafety Laboratory, told China Global Television Network: "There is absolutely no way that the virus originated from our institute."
